

## Donaghys Premium Bloat

Premium Bloat is a blended mixture of Alcohol Ethoxylates for drenching and trough treatment to prevent and control frothy bloat in cows. Contains 80% Alcohol Ethoxylate and food grade red dye as colorant.

- Cold water soluble
- Red colour for identification
- Viscosity controlled for ease of mix
- Compatible with soluble or suspension additives
- Low dose rate for effective control - 80% Alcohol Ethoxylate
- Long persistence time in the rumen

### DIRECTIONS FOR USE:

As a guideline the starting dose should be 5ml per cow and then adjusted upwards or downwards depending on results. A low dose of 3 to 4ml per cow may be sufficient in mild conditions but the farmer must adjust for conditions if they change.

#### Routine Drenching:

Add Premium Bloat to cold or warm water and mix thoroughly.

**Mild Bloat** – Use 5 to 7ml Premium Bloat per cow into water per drenching dose.

**Moderate Bloat** – Use 7 to 10ml Premium Bloat per cow into water per drenching dose.

**Severe Bloat** – Use 10 to 15ml Premium Bloat per cow into water per drenching dose.

NB. These directions are guidelines only; if control is not achieved increased dosing may be necessary. Do not exceed 25ml of Premium Bloat at a single drenching, as this may be detrimental to the health of the cow.

#### Water Trough Treatment:

Premium Bloat is readily soluble in all proportions with cold water. Calculate dose level required per cow and either add this amount directly to the trough or via an automatic dispenser. Initially use 3ml Premium Bloat per cow per day starting approximately 10 days before bloat problems are expected (this will get the cows used to the changed taste of the water). As mild bloat is observed, increase the dose to 5ml, 10ml or at times of severe bloat 20ml per cow per day. Reduce concentration levels in the water slowly observing for signs of bloat. Treat all water supplied available for stock until sure the bloat problem is finished.

#### Treatment of Severe Bloat:

Mix 20 to 30ml of Premium Bloat with 100 to 300ml of water. Dose affected cows with drench gun or bottle and watch for effective control. For rapid treatment use a large amount of warm water, e.g. 300ml.
