

Torpedo Dispenser

Drum Size	10 litre	20 litre
½ Full	3 Hours	5 Hours
Full	6 Hours	10 Hours

Dispensing times (approximate):

Instructions

Calculate value required by multiplying dairy dose rate by number of animals

Add this volume of product to container – then fill or half fill with water depending on desired dispensing time. Leave at least 50mm air space for floatation

Fit torpedo dispenser and place inverted container in trough supplying all animals (animals need to assess this trough only)

Place daily, early morning, before bulk drinking begins. Shake container at afternoon milking. Next morning empty contents left into trough, then put in fresh mix to container cycle

Cool/wet days, maybe reduce dose or apply every 2-3 days
