## **Woodend Autumn**

The trial was on a Woodend dairy farm. The trial area was irrigated ryegrass-white clover based pasture. The plots were measured at Day 21. The experiment was conducted with five blocks over three different paddocks.

LessN 40 was just slightly above the performance of Urea 80 (this was not statistically significant). Both of these treatments were, however, statistically significantly above control.

Table and Graph of Pasture Dry Matter Production (kg/ha) Day 21

Treatment	DM Day 21
Control	1774 <sup>a</sup>
Urea 80	2106 <sup>b</sup>
LessN 40	$2117^{b}$

<sup>\*</sup> Treatments that share the same letter are not statistically significantly different from each other (95% confidence level).
